A decision layer between you and your AI.

One board for all your projects: the AI works on several projects at the same time, asks you, and you decide.

fabBoard is a free program for everyone who wants to work on their own projects with an AI model of their choice – without chatting and without technical knowledge. Each project, whether a website, a text, a research task or a piece of software, has its own board and its own folder.

This is what a project looks like: the AI has put a question with options and a recommendation on the board.

HOW IT WORKS

01 Write a task

Write on the board what the AI should do – just like a message.

02 Start the AI

One click, and the AI works in the project folder. Meanwhile you start it on the next project.

03 Decide any time

The AI puts its questions with options and a recommendation on the board. You click an answer, it implements it.

WHY FABBOARD?

Several projects at once: in one window, you keep the overview.

Any AI you like, per project: Claude, ChatGPT, Gemini, Mistral or a model on your own computer.

Your data stays with you: plain files on your computer, no account, no statistics.

You decide, the AI works: every decision stays documented on the board.

Setup without prior knowledge: install the AI with one click and sign in in your browser.

Free and open source: MIT licence, German and English, light and dark.

WHAT YOU NEED

· Windows 10 or 11 (Mac planned)
· An account with an AI (e.g. Claude or ChatGPT), your own API key or a model on your own computer
· Nothing else: fabBoard fetches everything it needs by itself, without administrator rights.
